

Amendments to the Claims:

The listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1. (Canceled)

2. (Currently Amended) A network apparatus comprising:

a main device operable to be linked to a network; and

a portable remote controller device operable to remotely control the main device by way of communication,

wherein the remote controller device includes:

a first display operable to display information sent from the main device;

an identification code storage storing an identification code of the remote controller; and

an identification code sending section operable to send the identification code to the main device;

wherein the main device includes:

an access destination storage storing the identification code of the remote controller and an access destination in the network in a one-to-one correspondence;

an access section operable to access the access destination corresponding to the identification code sent from the remote controller device and obtain the information from the access destination; and

an information sending section operable to send the obtained information to the remote controller device; ~~and~~

~~a second display operable to display the obtained information;~~

wherein the main device is configured to be connected to a second display operable to display the obtained information;

wherein the remote controller device is operable to send a display switching signal to the main device; and

wherein the main device determines whether the second display displays the obtained information based on the display switching signal sent from the remote controller device.

3. (Canceled)

4. (Previously Presented) The network apparatus according to claim 6, wherein

the first display of the remote controller device includes a title displaying section operable to display a title of the information sent from the main device.

5. (Previously Presented) The network apparatus according to claim 4, wherein

when the displayed title is specified, the first display of the remote controller device displays a content of the information corresponding to the specified title.

6. (Currently Amended) A network apparatus, comprising:
a main device operable to be linked to a network; and
a portable remote controller device operable to remotely control the main device by way of communication,

wherein the remote controller device includes:

an access destination specifying section operable to specify an access destination in the network and send the specified access destination to the main device;

a first display operable to display information sent from the main device; and

an identification code storage storing an identification code of the remote controller;

wherein the main device includes:

an access section operable to access the specified access destination and obtain the information from the access destination

an information sending section operable to send the obtained information to the remote controller device; and

~~a second display operable to display the obtained information;~~

wherein the main device is configured to be connected to a second display operable to display the obtained information;

wherein the information sending section of the main device appends an identification code to the information and sends the information together with the appended identification code to the remote controller device; and

wherein the remote controller device further includes a display disabling section that disables the first display to display the sent information when the appended identification code is not in conformity with the stored identification code.

7. (Currently Amended) The network apparatus according to claim 12
~~13~~, wherein

the main device and said remote controller device communicate
with each other using infrared rays.

8. (Previously Presented) The network apparatus according to claim
2, wherein

the first display of the remote controller device includes a title
displaying section operable to display a title of the information sent from the
main device.

9. (Currently Amended) The network apparatus according to claim
[[3]] 26, wherein

the first display of the remote controller device includes a title
displaying section operable to display a title of the information sent from the
main device.

10. (Previously Presented) The network apparatus according to claim
8, wherein when the displayed title is specified, the first display of the remote
controller device displays a content of the information corresponding to the
specified title.

11. (Previously Presented) The network apparatus according to claim 9, wherein when the displayed title is specified, the first display of the remote controller device displays a content of the information corresponding to the specified title.

12. (Previously Presented) The network apparatus according to claim 2, wherein:

the information sending section of the main device appends an identification code to the information and sends the information together with the appended identification code to the remote controller device; and

the remote controller device further includes a display disabling section that disables the first display to display the sent information when the appended identification code is not in conformity with the stored identification code.

Claims 13-15 (Canceled)

16. (Previously Presented) The network apparatus according to claim 2, wherein

the main device and the remote controller device communicate with each other using infrared rays.

17. (Canceled)

18. (Previously Presented) The network apparatus according to claim 4, wherein

the main device and the remote controller device communicate with each other using infrared rays.

19. (Previously Presented) The network apparatus according to claim 5, wherein

the main device and the remote controller device communicate with each other using infrared rays.

20. (Previously Presented) The network apparatus according to claim 6, wherein

the main device and the remote controller device communicate with each other using infrared rays.

21. (Canceled)

22. (Currently Amended) A method for accessing information over a network, comprising:

sending a request for information from a portable remote controller device having a first display to a main device ~~having~~ configured to be connected to a second display;

obtaining the requested information from the network;

providing the obtained information from the main device to the remote controller device;

displaying the sent information on the first display of the remote controller device;

sending a display switching signal from the remote controller device to the main device; and

determining whether the second display of the main device displays the obtained information based on the display switching signal sent from the remote controller device.

23. (Previously Presented) The method of claim 22, further comprising:

sending another display switching signal from another remote controller device to the main device; and

determining whether the second display of the main device displays information requested from the another remote controller device based on the another display switching signal sent from the another remote controller device.

24. (Currently Amended) ~~The method of claim 23, further comprising:~~ A method for accessing information over a network, comprising:

sending a request for information from a portable remote controller device having a first display to a main device;

obtaining the requested information from the network;

providing the obtained information from the main device to the remote controller device;

displaying the sent information on the first display of the remote controller device;

sending a display switching signal from the remote controller device to the main device; and

determining whether a second display coupled to the main device displays the obtained information based on the display switching signal sent from the remote controller device;

sending another display switching signal from another remote controller device to the main device;

determining whether the second display of the main device displays information requested from the another remote controller device based on the another display switching signal sent from the another remote controller device;

storing in the main device, an identification code, electronic mail address and password of each of the remote controller device and the another remote controller device in a one-to-one correspondence.

25. (Previously Presented) The network apparatus of claim 6, wherein the main device includes a storage that stores the identification code, electronic mail address and password of the remote controller device in a one-to-one correspondence.

26. (Previously Presented) The network apparatus according to claim 2, wherein

the access destination storage stores a mail address as the access destination.
